Agenda

1. US1k Model Background and Case Studies
2. Look Back at Winter
3. Cooling Season Forecast
4. Tropical Outlook
5. Energy Survey

Freezing Rain

Wet Snow

Icing

Downbursts

Line Galloping

Severe Weather

Curtailments

Wake Effects

Ramps

Thunderstorms

Wind

Gusts

Icing

Extreme Wind Events

A large solar panel array is shown in a field, tilted at an angle. The panels are dark blue with a grid of silver lines. The background is a hazy, foggy landscape with a hill visible in the distance. The sky is overcast and grey.

Thunderstorms

Clouds

Fog

Dust

Fresh Snow

Icing

Extreme Solar Events

The background of the image is a blurred financial market chart. It features a dark background with blue and yellow candlestick patterns, indicating price movements. A yellow line, possibly a moving average, is visible. The overall image conveys a sense of market activity and volatility.

Growing Renewables

Price Spikes

Negative Prices

Increasing Market Volatility

A map of the United States with a white power grid overlay. The grid is most dense in the eastern half of the country and the West Coast. A specific region in the southwestern United States, covering parts of California, Arizona, and New Mexico, is highlighted with yellow and red lines. A semi-transparent dark grey rectangle is centered over the map, containing the title text.

Severe Weather Renewables Ramp Rates

Grid Operations & Weather Monitoring

An abstract graphic with a dark blue background. On the left, three horizontal lines of binary code (0s and 1s) in cyan, magenta, and yellow are shown. From these lines, a series of thin, flowing, multi-colored lines (cyan, magenta, yellow, and blue) curve and spread out towards the right. On the right side, there is a dense field of small, multi-colored dots (cyan, magenta, yellow, and blue) and a background of faint, multi-colored binary code. The text 'Traditional Weather Models' is centered in the middle of the image in a large, white, sans-serif font. Above this text, the words 'Lower Resolution' and 'Less Updates' are written in a smaller, yellow, sans-serif font, separated by a small gap.

Forecasting Hurricane Helene with US1k

Forecasting Hurricane Helene with US1k

US1k RMSE: 5.3 (mph)
AIFS RMSE: 6 (mph)
HRRR RMSE: 5.6 (mph)

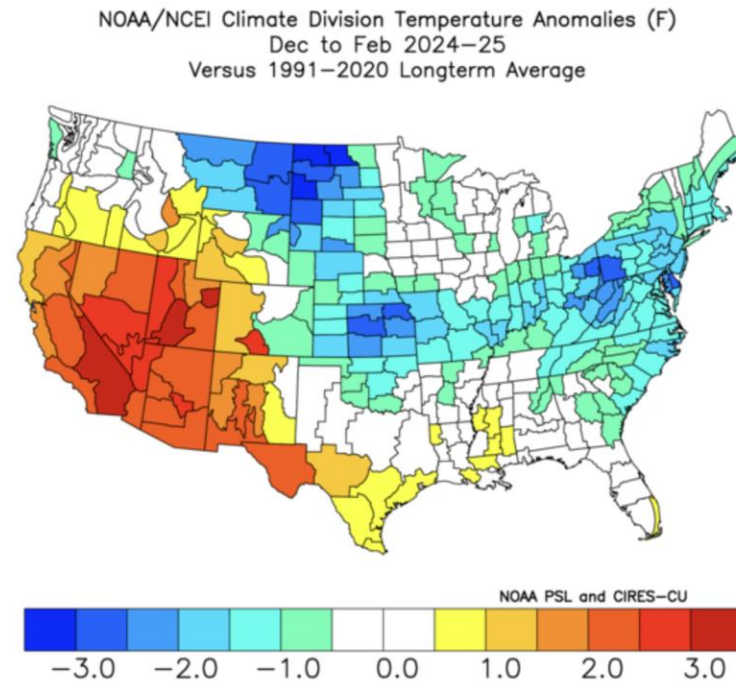

US1k forecasted wind speeds (10 m) during Hurricane Helene more accurately than HRRR and AIFS at these station locations.

Heating Season 2024-25

Heating Season Summary

1. October forecasts were warm South and East
2. Weak La Nina arrived later than forecast
3. Volatility captured, including mid-January cold

Risk to Temperatures - Houston

➡ Forecast updated: 28 October

Risk to Temperatures – New York

meteomatics.com

➡ Forecast updated: 28 October

Risk to Temperatures – Chicago

meteomatics.com

➡ Forecast updated: 28 October

Cooling Season Forecast

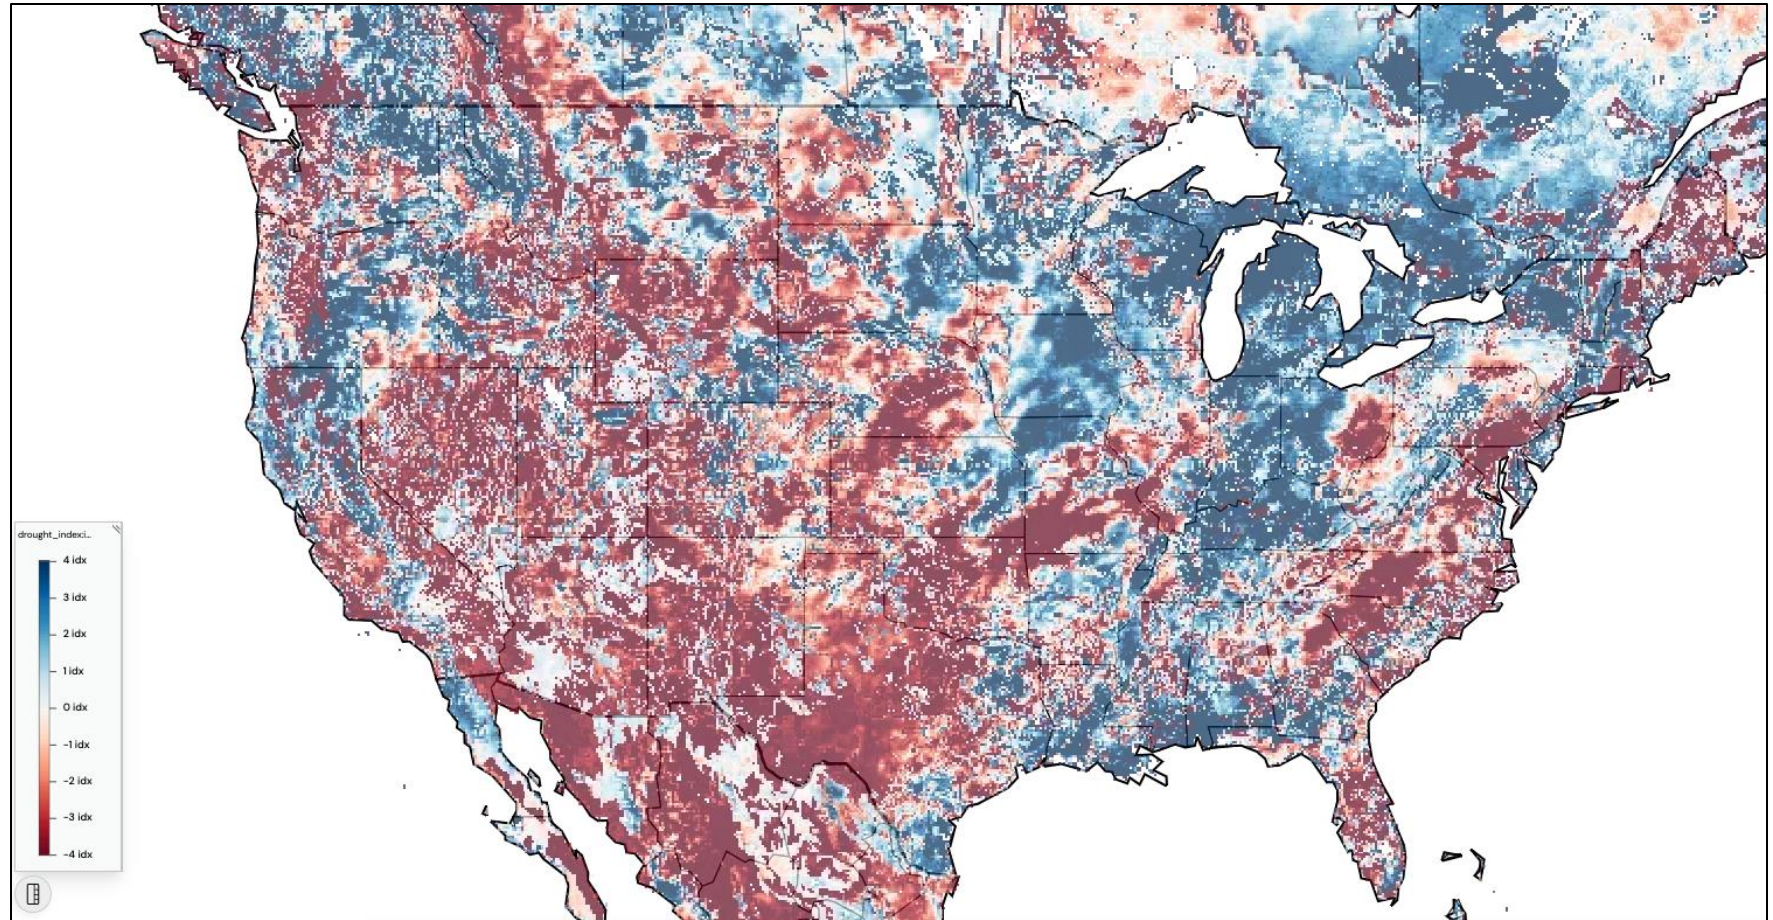

Status of Central Pacific

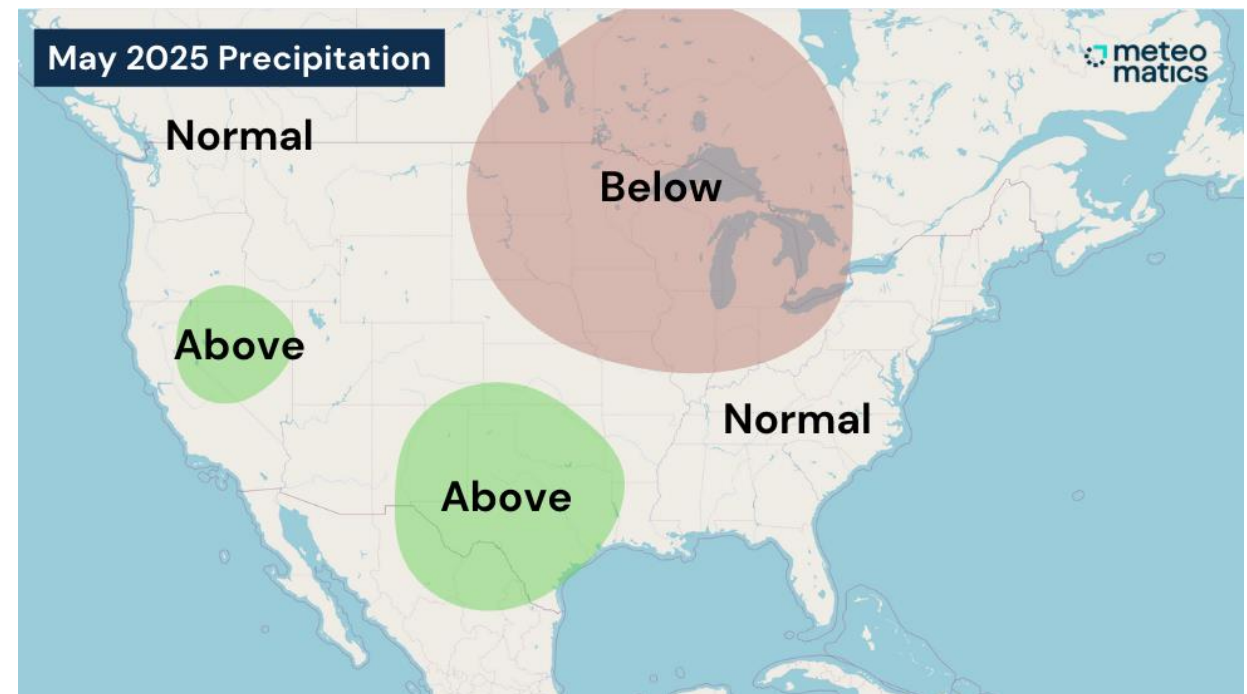

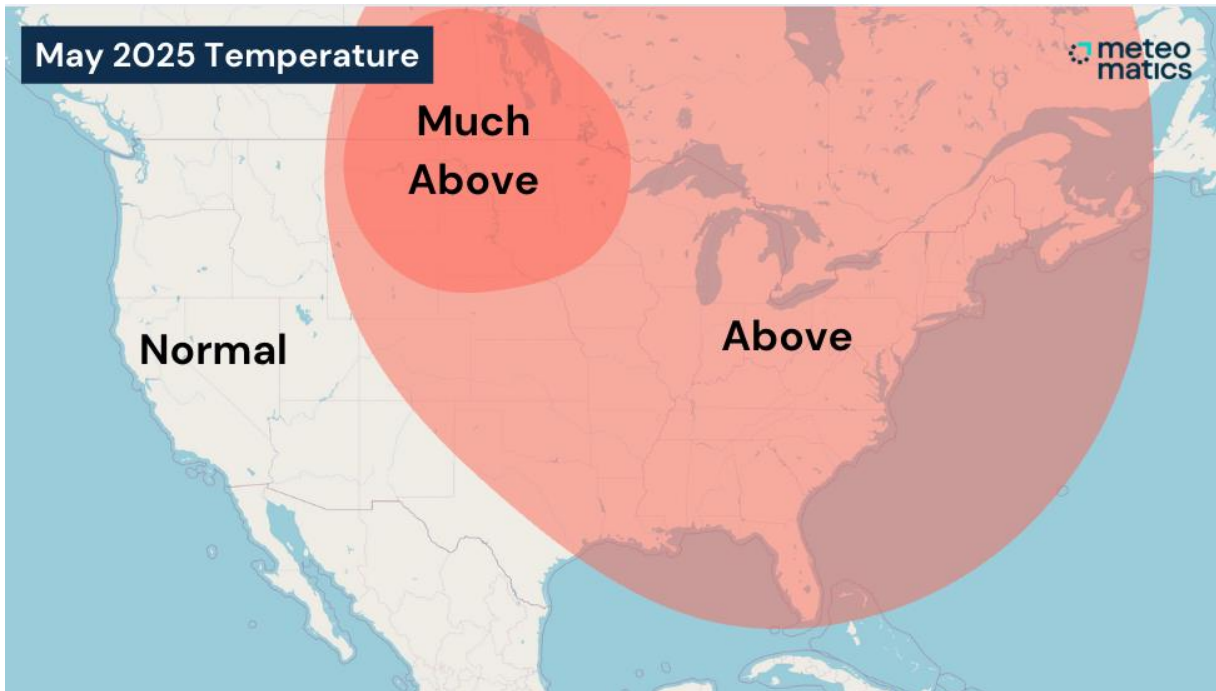

➡ Summary: ENSO Neutral

Drought Update

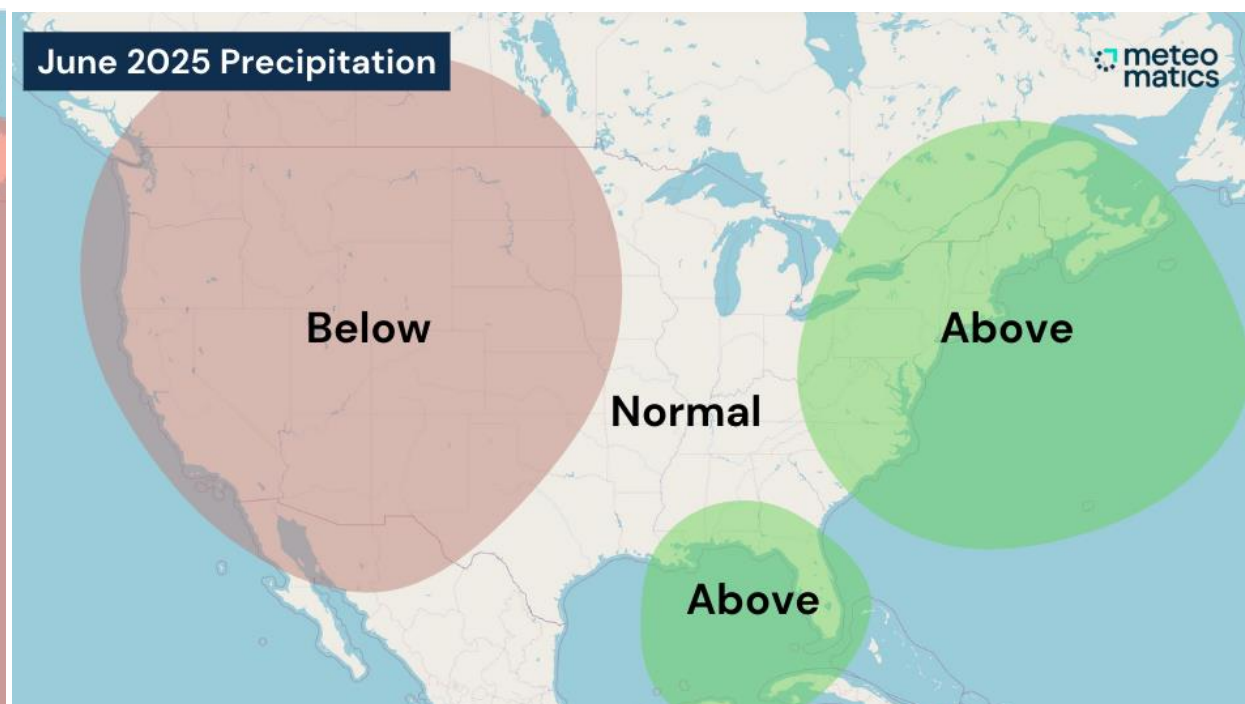

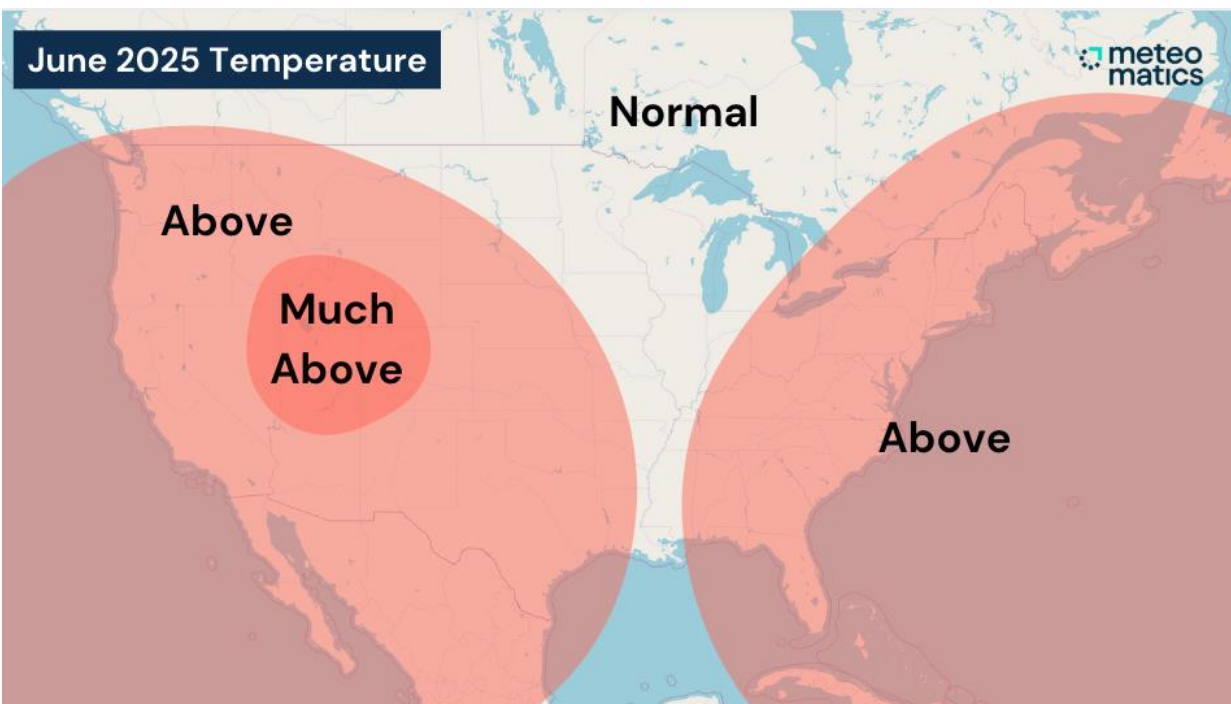

➡ Summary: SPP, ERCOT and eastern PJM will be monitored

May 2025

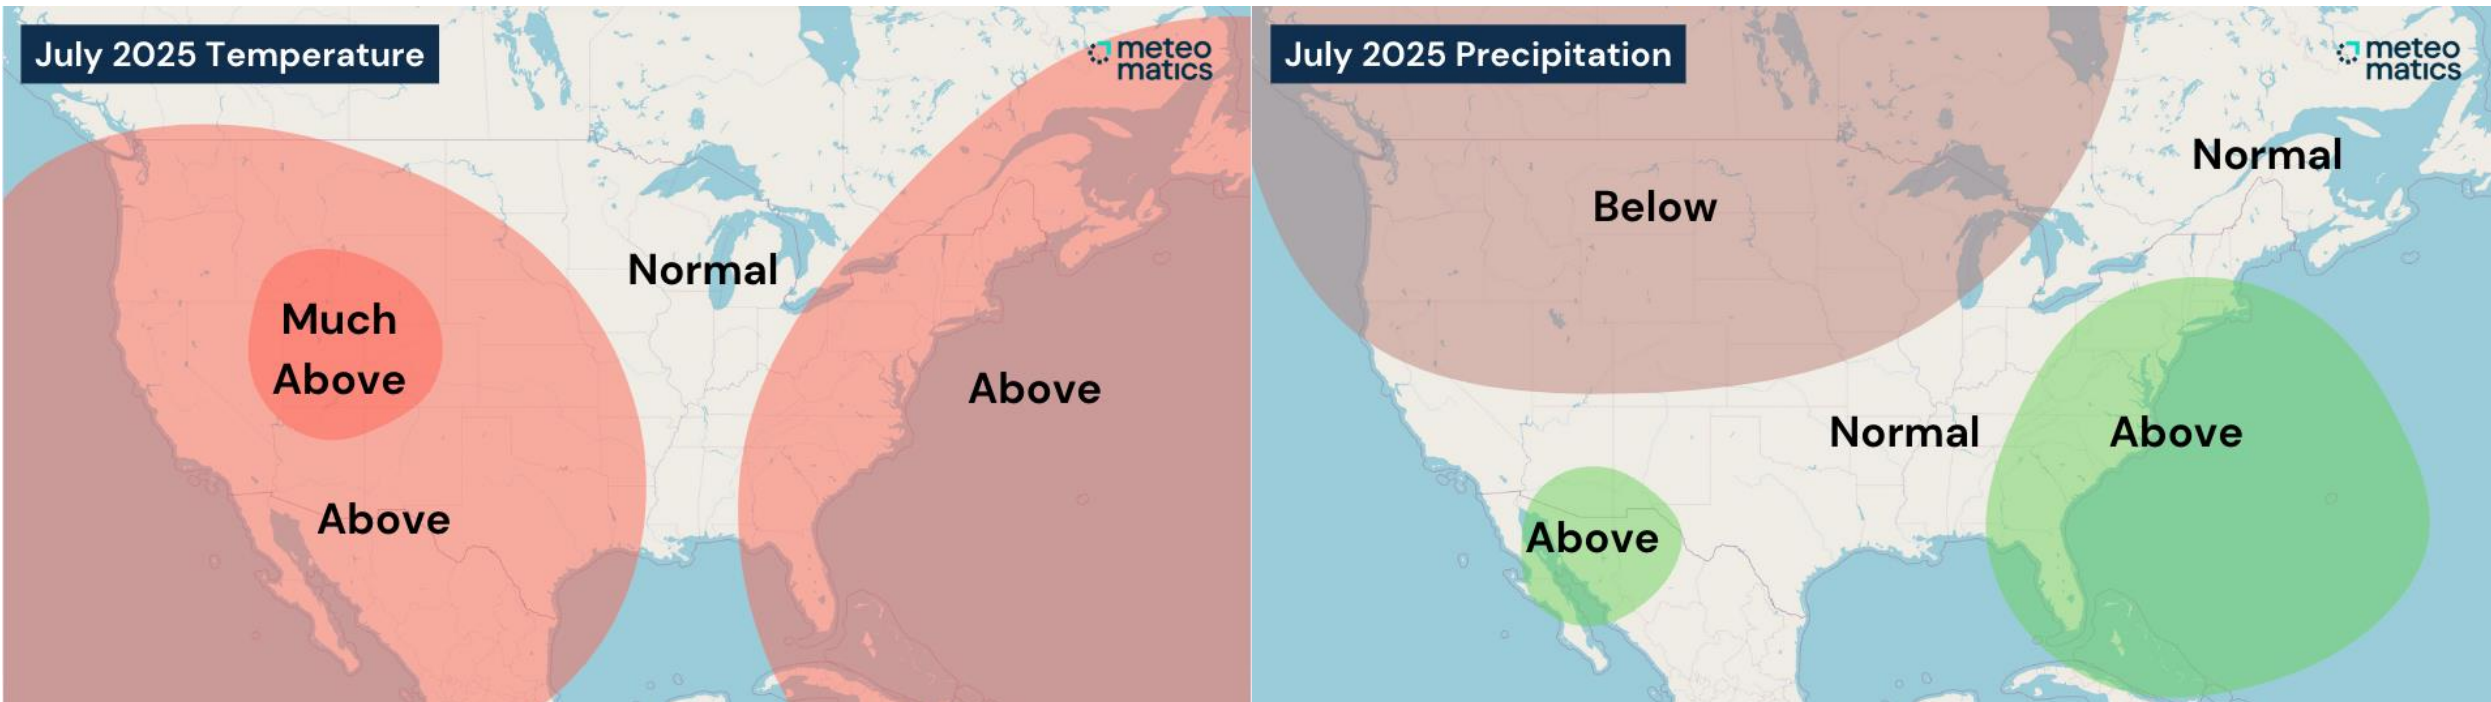

- ➡ Risk: Drier in Midwest
- ➡ Risk: Warmer in western PJM and MISO
- ➡ Summary: Slow, gradual run-off season in PacNW

June 2025

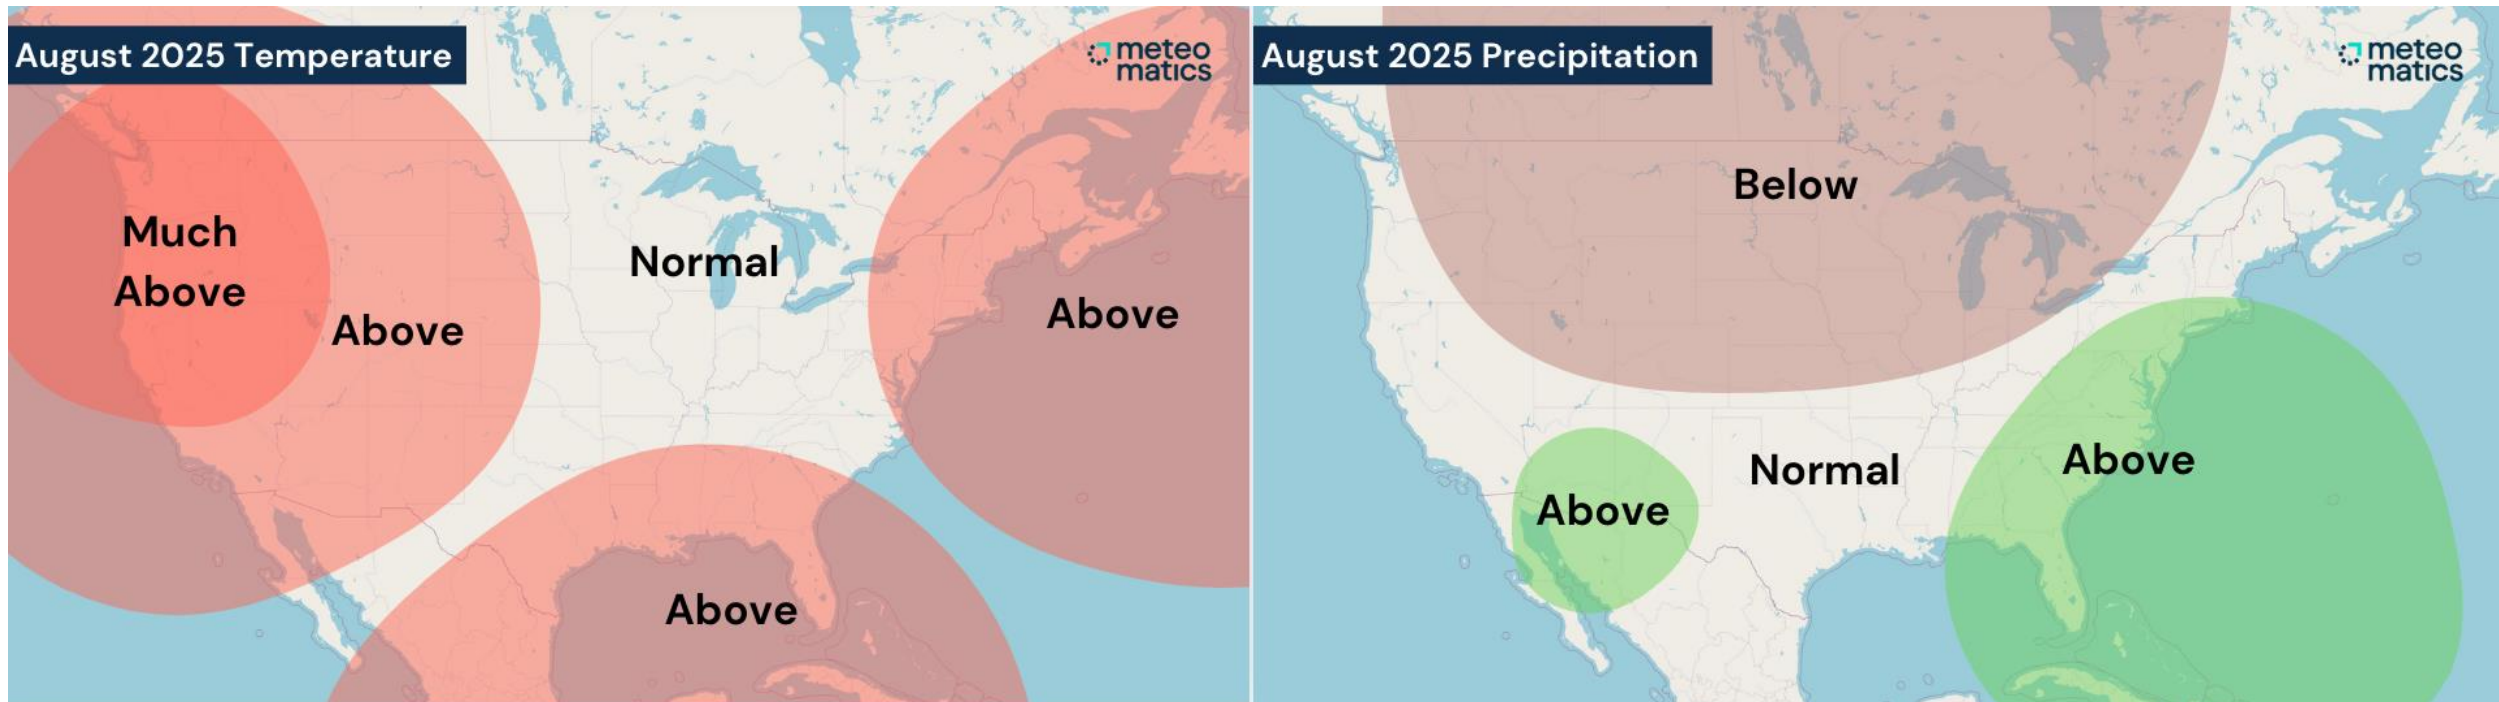

- ➡ Risk: Warmer in ERCOT
- ➡ Risk: Wetter in Southwest with faster monsoon onset
- ➡ Summary: Humidity/rain in eastern PJM could impact load

July 2025

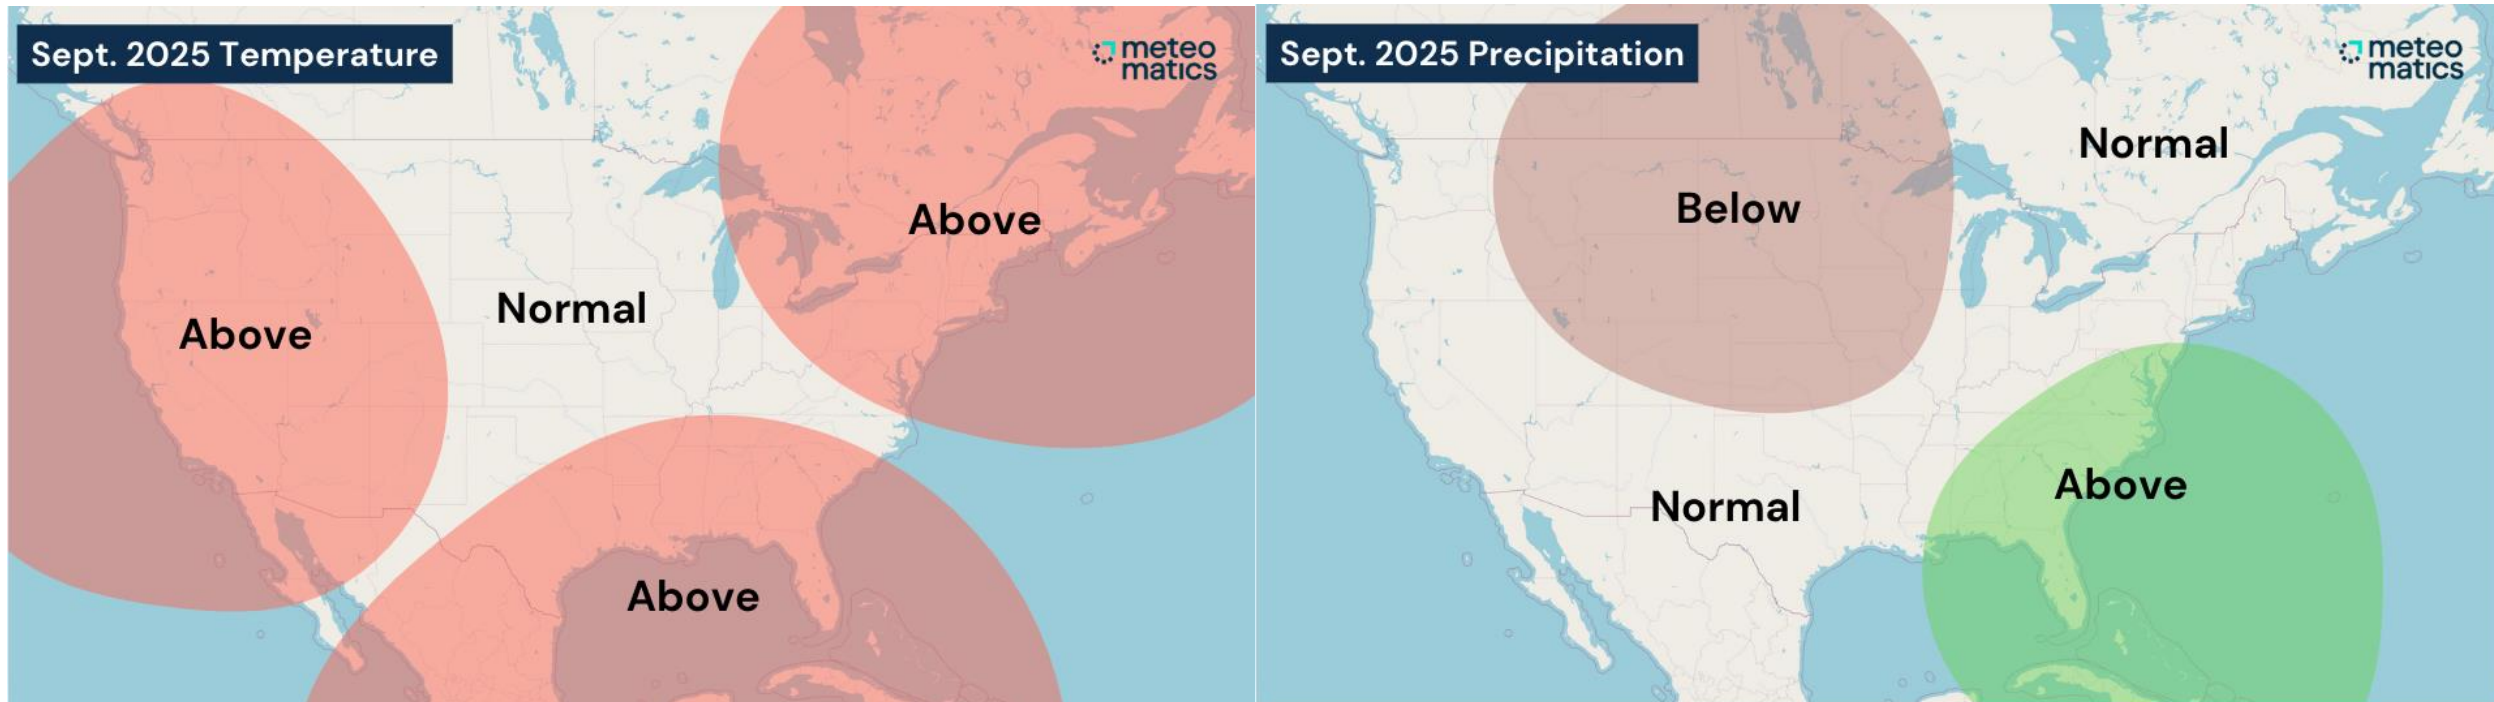

- ➡ Risk: Warmer in ERCOT and western PJM
- ➡ Risk: Drier in ERCOT
- ➡ Summary: Humidity/rain in eastern PJM could impact load

August 2025

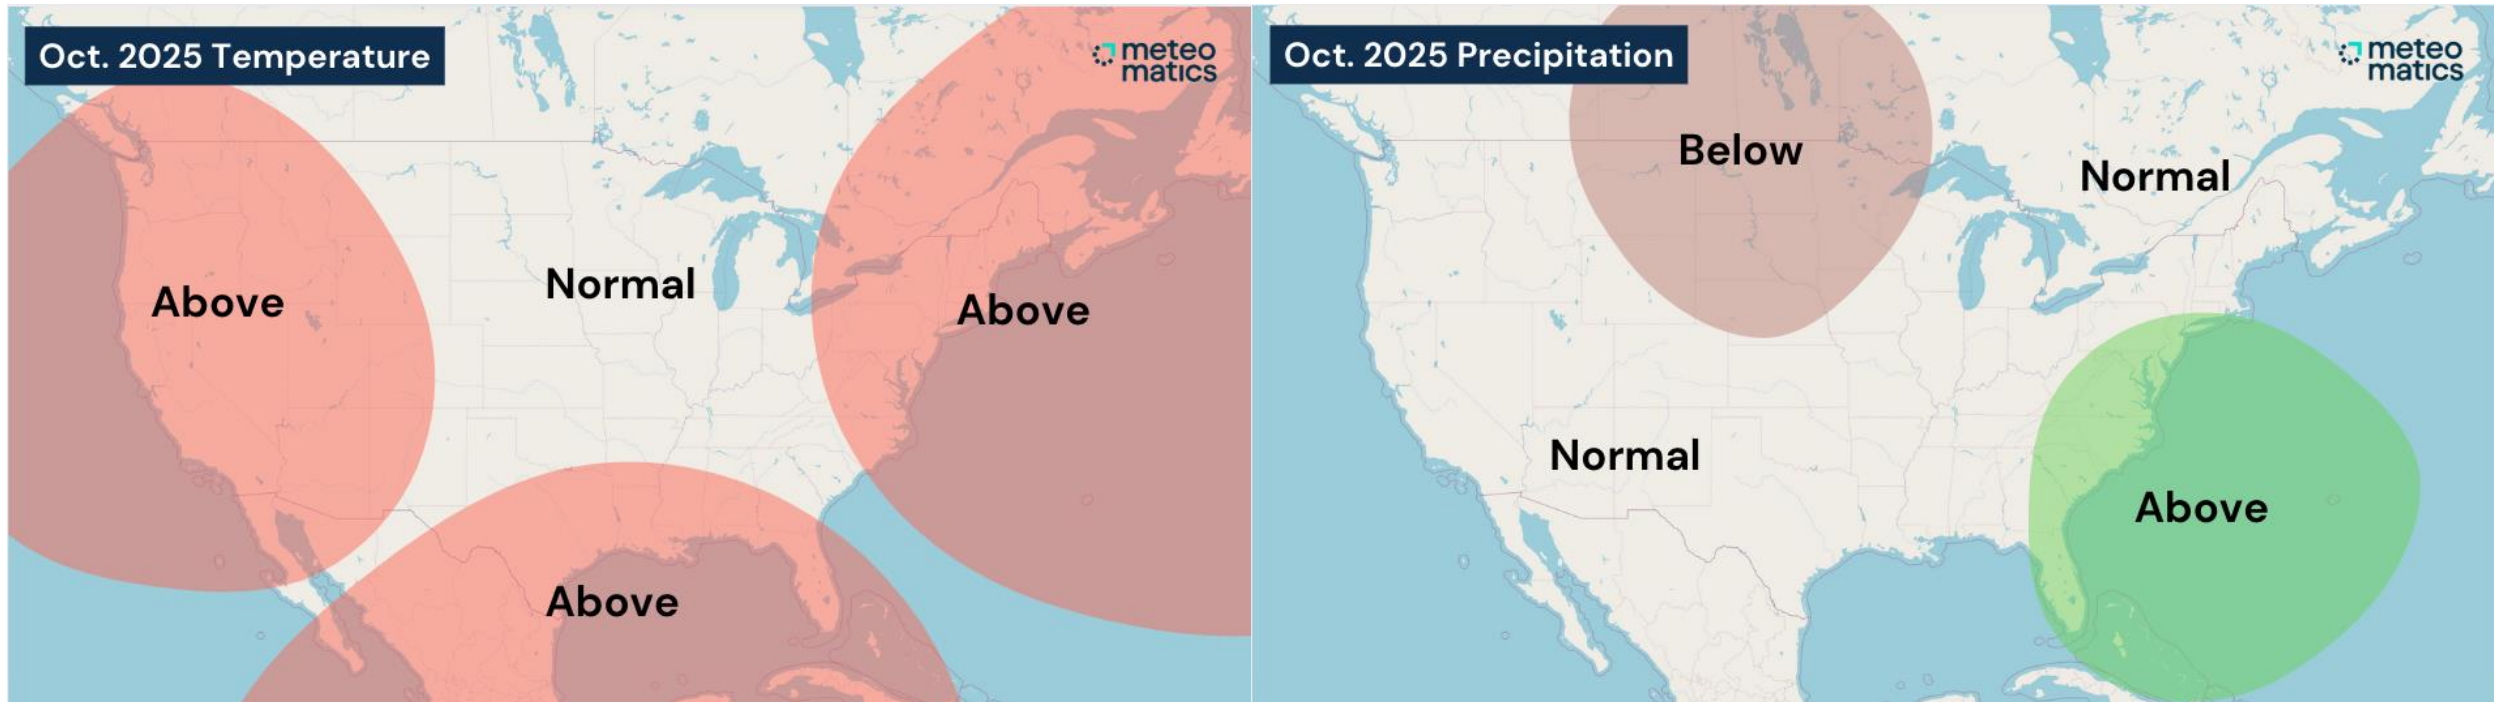

- ➡ Risk: Warmer western PJM
- ➡ Summary: Humidity/rain in eastern PJM could impact load

September 2025

- ➡ Risk: Warmer in ISO-NE
- ➡ Summary: Southeast and eastern Gulf watching tropics

October 2025

- ➡ Risk: Warmer in NYISO and ISO-NE
- ➡ Summary: Overall seasonal to warm

Risk to Temperatures – Houston

10th–90th quantile 10–year average Ensemble Mean

Risk to Temperatures – New York

10th–90th quantile 10-year average Ensemble Mean

Risk to Temperatures – Chicago

10th–90th quantile

10-year average

Ensemble Mean

Tropical Outlook

1. Above normal activity with 17 tropical storms, 10 hurricanes and 4 major hurricanes
2. Sea-surface temperatures above normal in Gulf, which could rapidly intensify storms
3. Bermuda ridge set-up favors tracks toward eastern Gulf and Southeast impacts

Summer/Tropics Summary

1. Rather warm across the West, ERCOT and East Coast
2. Risk to be warmer in western PJM
3. Eastern PJM rain could impact load
4. Tropics active, once again, for eastern Gulf and East Coast

Survey Results

Survey Overview

n = 100%

- **Research Objectives:** Report on the use and impact of weather data on operations to serve senior energy industry professionals

- **Sampling Criteria:**

Senior Position / Decision Maker

Experienced in Energy Industry

Works for Large Corporation

Resides in the US

Outsources Weather Data

Employed Full-Time

- **Industries:**

1. Energy Trading
2. Grid Operations
3. Energy Utilities

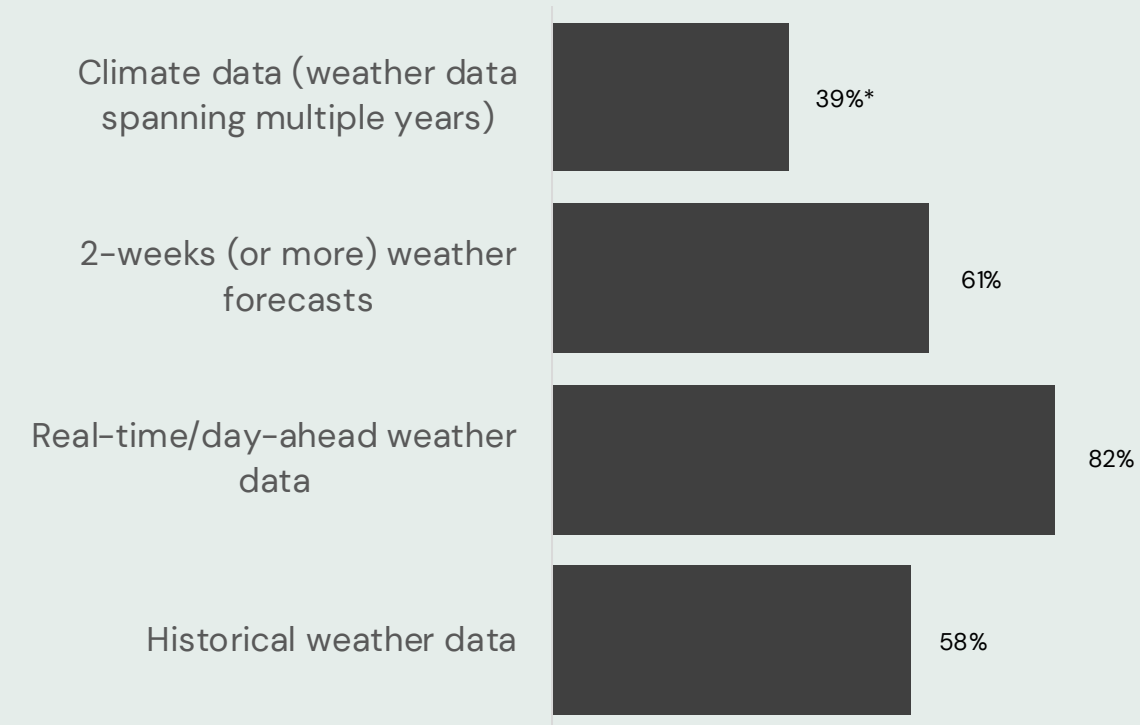

n = 31%

n = 24%

n = 45%

**65% of participants use a mix of in-house and 3rd party tools.
Real-time/day-ahead data is used by 82%.**

What Type of Weather Data Do You Rely On?

* % of participants who chose this answer

(select all that apply)

What Type of Forecasting Tech Does Your Company Use?

(select one)

What challenges do you currently face, if any, when using in-house/self-developed weather forecasting technology?

(select all that apply)

➡ Participants need high-accuracy, simple and low-maintenance solutions!

Weather data is needed by 66% of respondents on a daily or weekly basis. The geographical focus is predominantly national.

How frequently does your organization rely on weather data?

(select one)

What are your geographic markets of interest for weather data?

* % of participants who chose this answer

(select all that apply)

While 81% of participants indicate that their forecasts have a high accuracy of 60%–99%, it is still the 2nd biggest challenge after resolution.

How accurate are your company's weather forecasts?

(select one)

What are your top 3 challenges with the current weather data?

1. The resolution of the weather data is not good/high enough.
2. The accuracy and reliability of the weather data is not sufficient.
3. Inefficient data delivery process (speed, high manual workload, etc.).
- ...
9. Data is not actionable.

(rank top three)

What would be the most helpful tool or enhancement that would make the weather data that you use more actionable for business decisions?

(open-ended answers; **consolidated with LLM**)

How helpful would each of the following be in making the weather data you use more actionable for business decisions?

	Not at all helpful		Very helpful		
	1	2	3	4	5
Artificial Intelligence (AI)/ Machine Learning (ML)	0	1	41	114	116
Visualization and animation of weather data on customizable maps	0	1	48	136	87
Mobile access to weather forecasts, analytical dashboards, and other weather insights	0	0	50	128	94
Dashboards and platforms with intuitive and easy-to-use navigation (also for non-professionals in meteorology)	0	6	47	132	87
Innovative tools around weather data collection (i.e. weather drones)	0	0	49	136	87

AI would provide most value to make data more actionable for decisions!

Both weather data and climate data are expected to significantly increase in importance within the next few years.

How do you expect your reliance on weather data to evolve in the next 3–5 years?

(select one)

How do you expect your reliance on climate data to evolve in the next 3–5 years?

(select one)

Hurricanes, Floods and Heat Waves have had the highest impact on businesses.

What types of extreme events have impacted your business the most?

* % of participants who chose this answer

(select up to five)

Stairway to Heaven

Data Collection

- ✓ ERA5 until 1940
- ✓ Stations
- ✓ Satellites
- ✓ Radar
- ✓ Lightning
- ✓ Ocean data
- ✓ Atmospheric data

Meteodrones

Weather Models

- ✓ Over **30 weather models** from third parties (global, local)
- ✓ **EURO1k** and **US1k**
- ✓ **AI weather models** (AIFS, GraphCast, 4Cast)

**EURO1k
US1k**

Data Fine-Tuning

- ✓ **Downscaling:** 90 m downscaling technique based on NASA terrain data
- ✓ **Calibration:** further calibration with the latest observations from nearby weather stations.

90 m Downscaling

Data Delivery & Access

- ✓ real time data access through our unique **Weather API**
- ✓ Visualize all Weather Data with our weather map tool **MetX**
- ✓ Calibrated and site-specific **Energy Power Forecasts**

**Weather API
